## Mitral valve prolapse: role of 3D echocardiography in diagnosis

Ricardo Benenstein and Muhamed Saric

### Purpose of review

To review the utility and the latest developments in three-dimensional (3D) echocardiography of mitral valve prolapse.

### Recent findings

Although 3D echocardiography was invented in 1974, it did not gain wide clinical acceptance until the introduction of real-time 3D echocardiography in the first decade of the 21st century. Driven by improvements in probe technology and increases in computing power, 3D echocardiography now provides unprecedented images of mitral valve prolapse and its associated mitral regurgitation with no or minimal requirements for image post processing.

### Summary

3D echocardiography has become the echocardiographic modality of choice for establishing the diagnosis, describing the precise anatomy, and visualization of mitral regurgitant jets in mitral valve prolapse. 3D echocardiography is becoming indispensable in guiding surgical and percutaneous methods of mitral valve repair and replacement.

### Keywords

mitral valve prolapse, real-time 3D echocardiography, transesophageal echocardiography, transthoracic echocardiography

## INTRODUCTION

The word prolapse (from Latin 'to slip forward') has been used since the 17th century to refer to slipping of a body part (such as the uterus) from its usual position. It appears that the term prolapse was first applied to the mitral valve in 1966 by Criley *et al.* [1].

annulus, MVP is often difficult to fully characterize by cross-sectional imaging techniques such as 2D echocardiography. Real-time three-dimensional (3D) echocardiography – notably 3D transesophageal echocardiography (3D-TEE) – provides unprecedented views of the mitral valve apparatus, including the unique real-time en face view of the

## 4 Questions to Answer

- **Q1 : Mitral regurgitation type**
  - Is mitral regurgitation degenerative or functional?
- **Q2: Severity of mitral regurgitation**
  - Is mitral regurgitation at least moderate to severe (3+ or 4+)?
- **Q3: Mitral valve anatomy**
  - Is mitral valve anatomy suitable for clipping?
- **Q4: Contraindication**
  - Are there any general procedural contraindication for this left atrial procedure?

# MitraClip® Summary

*Muhamed Saric, MD, PhD  
New York University*

#### Mitral Clip Screening

### **Exclusion Criteria**

Below are the basic anatomic **exclusion** criteria for mitral valve clipping in addition to the following:

- ▶ A2 or P2 calcification in the grasping area or the presence of any significant cleft
- ▶ Primary regurgitant jet NOT originating from malcoaptation of the A2 and P2
- ▶ Severe mitral annular calcifications
- ▶ Mitral stenosis (mitral valve area < 4.0 cm<sup>2</sup>)
  
- ▶ LV end-systolic diameter > 5.5 cm
- ▶ LVEF ≤ 25%
  
- ▶ Presence of ASD (whether repaired or not) or significant atrial septal aneurysm
- ▶ Presence of LA thrombus, vegetation or mass
- ▶ Presence of PFO associated with clinical symptoms

# Question

---

Should this patient undergo mitral clip procedure?

# Answer

---

Because the patient has **severe symptomatic mitral regurgitation**  
AND is **high surgical risk...**

...he should be evaluated for **mitral clip**  
as he has high surgical risk.
